; Sequence 789, Application US/09583110
; Patent No. 6699703
; GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al.
TITLE OF INVENTION: Nucleic Acid and Amino Acid Sequences Relating to Streptococcus
TITLE OF INVENTION: Nucleic Acid and Amino Acid Sequences Relating to Streptococcus
TITLE OF INVENTION NUMBER: US/09/583,110
CURRENT APPLICATION NUMBER: US/09/583,110
CURRENT APPLICATION NUMBER: US 09/107,433
PRIOR APPLICATION NUMBER: US 09/107,433
PRIOR APPLICATION NUMBER: US 60/085,131
PRIOR APPLICATION NUMBER: US 60/085,131
PRIOR APPLICATION NUMBER: US 60/085,131
PRIOR APPLICATION NUMBER: US 60/085,131
PRIOR APPLICATION NUMBER: US 60/085,131
PRIOR FILING DATE: 1998-05-12
PRIOR APPLICATION NUMBER: US 60/051,553
PRIOR FILING DATE: 1997-07-02
NUMBER OF SEQ ID NOS: 5322
SEQ ID NO 789
LENGTH: 378
TYPE: DNA
ORGANISM: Streptococcus pneumoniae

ADX46590

The invention relates to a novel method for surface expression of peptides P5 and Anal3 using a poly-gamma-glutamic acid synthase (pgs)BCA gene, thereby removing a purification process of peptides P5 and Anal3, and using lactic acid bacteria for the surface expression, so that peptide antibiotics can be cheaply and stably mass-produced. An

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expression vector pHCEILB:pgsA-P5 comprises one or more genes encoding poly-gamma-glutamic acid synthase selected from pgsB, pgsC and pgsA, and a gene for dipolar peptide antibiotics having antimicrobial, antifungal and anticancer activities, wherein the dipolar peptide antibiotic has homology to the peptide P5 encoded by the nucleotide sequence set forth in ADV65735, or to the peptide Anal3 encoded by the nucleotide sequence set forth in ADV65737. The present sequence encodes the peptide p5 used
                                                                                                                                 The invention relates to a novel method for surface expression of peptides P5 and Anal3 using a poly-gamma-glutamic acid synthase (pgs)BCA gene, thereby removing a purification process of peptides P5 and Anal3, and using lactic acid bacteria for the surface expression, so that peptide antibiotics can be cheaply and stably mass-produced. An expression vector pHCEILB:pgsA-P5 comprises one or more genes encoding poly-gamma-glutamic acid synthase selected from pgsB, pgsC and pgsA, and a gene for dipolar peptide antibiotics having antificrobial, antifungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 61 BP; 23
a gene for dipolar peptide antibiotics having antimicrobial, antifungal and anticancer activities, wherein the dipolar peptide antibiotic has homology to the peptide P5 encoded by the nucleotide sequence set forth in ADV65735, or to the peptide Anal3 encoded by the nucleotide sequence set forth in ADV65737. The present sequence represents an oligonucleotic used in the invention to introduce the peptide p5 encoding DNA into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; gene expression; antibiotic;
                                                                                                                                                                                                                                                                                                                                                                                                     Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (AXCH-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-OCT-2002; 2002KR-00063379

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                               The invention relates to enzymes involved in C1 assimilation in Methylophilus methylotrophus and their corresponding polynucleotides. The invention also relates to methods of producing amino acids in microorganisms having enhanced or attenuated expression of the polypeptides and polynucleotides involved in C1 assimilation. The invention is useful for producing L-amino acids (e.g. asparagine, threonine or serine) using Methylophilus bacteria. It is also used in identifying microorganisms that can be used to produce fine chemicals, for e.g. by fermentative processes. The present sequence is M. methylotrophus gene encodoing an enzyme involved in C1 assimilation.
                                                                                                                                                                                                                                                                                                                                                      Claim 13; SEQ ID NO 11; 53pp; English
                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotides encoding polypeptides involved in one-carbon metabolism in Methylophilus methylotrophus, useful for producing acids (e.g. threonine or serine) or as probes and/or as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;

                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Plant; bacterial infection; fungal infection; viral infection; rice; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant

comprising a sequence capable of hybridising under stringent conditions (C) a sequence selected from any one of 999 sequences (ABN98233-ABN99231), (C) (I), a transgenic plant (III) comprising an exogenous nucleic acid or a genetically modified cell (IV) comprising an exogenous nucleic acid, is (C) useful in identifying homologous or related genes, in producing compositions that modulate the expression or function of its encoded protein, mapping functional regions of the protein and in studying compositions of various plant strains to determine the genetic are best capable of withstanding a particular disease or environmental composations are useful for screening assays of various plant strains to determine the strains that composation of the protein and in studying stress. (II) and (III) are useful for screening of biologically active agents, e.g. fungicides, insecticides, etc., for elucidating biochemical pathways. The screened agents are useful in improved methods of treating crops to prevent or treat disease. (II) are also useful in screening comporants to identify agents that mimic or enhance the action of tolerance composition of proteins of interest, for establishing the extent to which any specific insect and/or pathogen is responsible for damage to a particular plant, for identifying other mediators that may induce colerance to environmental stress, for identifying factors involved in biosynthetic pathways of nutritional, commercial or medicinal value and composition of the cellular metabolism and for screening compounds of the cellular metabolism and for screening compounds. (IV) is useful in the study of genetic function and regulation, components of the cellular metabolism and for screening compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID NO 854; 49pp + Sequence Listing; English.

 Arabidopsis thaliana. The SDFs are promoters, structural genes, untranslated regions (UTRs), or 3' termination sequences. They can be used for expressing a gene product and controlling expression of a target gene, either as a promoter, a structural gene, an UTR or as a 3' termination sequence. They are also useful as tools for genetic mapping, and identification of a particular individual plant or for clustering a group pf plants with a common trait. AAA78433 to AAA78630 and AAB24605 to AAB25099 represent the specifically claimed polymucleotide sequences and polymeptides encoded by them given in the present invention. (Updated on
 Plant; corn; Arabidopsis thaliana; sequence-determined DNA fragment; genetic mapping; identification; promoter; structural gene; UTR; untranslated region; expression control; ds.
 Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator;
 sequences and/or sequences of genomic DNA encompassing complete genes, portions of genes, and/or intergenic regions, collectively referred to sequence-determined DNA fragments (SDFs), from corn plants and
 New corn plant and Arabidopsis thaliana sequence-determined fragments, useful for expressing gene products and for contrexpression of a target gene.

 The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to CC promoter functional in a plant cell, where the promoter is positioned to CC microbial source. The invention also relates to a transformed plant CC comprising the recombinant DNA construct and a method of producing a CC transformed plant having an improved property. The plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant CC the recombinant DNA construct and growing the transformed plant with the CC recombinant DNA construct is useful for improving plant with the CC improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of Dnanlogous recombination, modified seed oil or protein yield and/or CC content, improved plant growth and development under at least one stress condition, improved lignin production of improved galactomannan cC condition, improved lignin production of improved galactomannan cc condition, improved lignin production a haterial not under at least one stress condition.
 Query Match
 New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
 production. This sequence represents a bacterial polynucleotide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electron format from USPTO at sequata.uspto.gov/sequence.html.

 encode corn tassel-derived polypeptides (CDBs). The cdps sequences can be used for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid breeding programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality and yield, and as molecular markers for studying inheritance of multigene traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a transcript image, to clone regulatory elements for use in transformation vectors, to express a polypeptide, to identify, isolate or extend identical or related corn tassel nucleic acid sequences from DNA libraries in minima.

 The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated or polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention

 CC leaf- and/or stem. panicle, root- or pollen-specific or -preferential
CC or constitutive transcription of an operatively linked nucleic acid
CC segment. The invention also relates to a method for augmenting a plant
CC genome and a method of identifying a gene, where its expression is
CC altered in the seed, leaf, stem, panicle, pollen, root or is constitutive
CC in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower,
CC canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,
CC sorghum, rice or wheat. The polynuclectides and the polypeptides they
CC sorghum, rice or wheat. The polynuclectides and the polypeptides they
CC encode are useful for manipulating crop plants to alter or improve
CC proteins, to incur resistance to insecticides, viruses or fungi, and to
CC incur stress tolerance (e.g. salt, cold or drought) to ensure the plants
CC have a high nutritional value with reduced apical dominance or dwarfism,
CC early flowering or altered metabolic pathways. This sequence earls enough to the invention. Note: The sequence terpresents a
CC plant nucleic acid of the invention. Note: The sequence obtained in
CC electronic format directly from USPTO at seqdata.uspto.gov/sequence.html.

 OM nucleic - nucleic search, using sw
 Total number of hits satisfying chosen parameters:
 Perfect score:
 95
 Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phired quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one Mis subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC. The following abbreviations are used to associate primary accession

Center project name: M\_BA0308L03

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e. phred quality >=30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest.

This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is

minima

If a sequence meets the criteria of the above statement, no comments or tags. If the criteria are not met, such a bases, then the region is duly annotated. not met, such as it needs ambiguous

MAPPING INFORMATION:

assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome On Jun 29, 2005 this sequence version replaced gi:62718973. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas Submitted (17-APR-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA of Molecular and Human Genetics, Baylor College Baylor Plaza, Houston, TX 77030, USA shotgun sequence only contigs will be indicated in the feature Submitted (01-JUL-2005) Human Genome Sequencing Center, Department of Medicine, One and separated

Center project name: FFDQ
center clone name: CH240-80023
center clone name: CH240-80023
Assembly program: Atlas 3.0;
Consensus quality: 244601 bases at least Q40
Consensus quality: 246532 bases at least Q30
Consensus quality: 246534 bases at least Q20
Estimated insert size: 247370; sum-of-contigs estimation Quality coverage: 6x in Q20 bases; sum-of-contigs http://www.hgsc.bcm.tmc.edu/ estimation

NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft data.html).
(NOTE: This is a 'working draft' sequence. It currently consists of 28 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are unknown.

runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence. as soon as it is available and the accession number will 50 bp of 1484 bp in length 27946 bp 12466 bp in length bp 5959 bp in length 6972 bp in length bp 8113 bp in length 12949 bp in length bp 9657 bp in length 1557 bp in length bp 18201 bp in length 28679 bp in length bp 4651 bp in length 30158 bp in length

 FEATURES
```

```
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome
table.
 genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
 and separated

 Submitted (01.7UL-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Jun 28, 2005 this sequence version replaced gi:57334865.
On Jun 28, 2005 this sequence version replaced gi:57334865.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirally of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature

 (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently
consists of 22 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence
 as soon as it is available and the accession number will be preserved.

 The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, B. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
 all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
 University School of Medicine, MO 63108, USA On Aug 16, 2002 this sequence v
 Submitted (30-APR-2005) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St.
 Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see

Clones are derived from the bovine BAC library CHORI-240
(http://www.chori.org/bacpac/bovine240.htm). For BAC library
(http://www.chori.org/bacpac/bovine240.htm). For BAC library
availability, please contact Fieter de Jong (pdejong@mail.cho.org).
Clones may be purchased from BACPAC Resources
(http://www.chori.org/bacpac/ordering_information.htm). This work
was undertaken as part of the International Bovine BAC Mapping
Consortium (IBBMC) by AgResearch Ltd., New Zealand and The
Institute of Genomic Research (TIGR), USA.

```

The invention relates to a novel method for surface expression of peptides P5 and Anal3 using a poly-gamma-glutamic acid synthase (pgs) BCA gene, thereby removing a purification process of peptides P5 and Anal3, and using lactic acid bacteria for the surface expression, so that peptide antibiotics can be cheaply and stably mass-produced. An

Example 3; SEQ ID NO 6; 25pp; Korean

gene.

The invention relates to a novel method for surface expression of peptides P5 and Anal3 using a poly-gamma-glutamic acid synthase (pgs)BCA gene, thereby removing a purification process of peptides P5 and Anal3, and using lactic acid bacteria for the surface expression, so that peptide antiblotics can be cheaply and stably mass-produced. An expression vector pHCELLB:pgsA-P5 comprises one or more genes encoding poly-gamma-glutamic acid synthase selected from pgsB, pgsC and pgsA, and a gene for dipolar peptide antiblotics having antimicrobial, antifungal and anticancer activities, wherein the dipolar peptide antibiotic has homology to the peptide P5 encoded by the nucleotide sequence set forth in ADV65737. The present sequence represents an oligonucleotide used in the invention to introduce the peptide Anal3 encoding DNA into
 expression vector pHCEILB:pgsA-P5 comprises one or more genes encoding poly-gamma-glutamic acid synthase selected from pgsB, pgsC and pgsA, and a gene for dipolar peptide antibiotics having antimicrobial, antifungal and anticancer activities, wherein the dipolar peptide antibiotic has homology to the peptide P5 encoded by the nucleotide sequence set forth in ADV65735, or to the peptide Anal3 encoded by the nucleotide sequence set forth in ADV65737. The present sequence encodes the peptide Anal3

 The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating comedical conditions e.g. by protein or gene therapy. The genes are comedicated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and covarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune concers, autoimmune themolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, allergies, autoimmune haemolytic candiovascular disorders such as myocardial ischaemias; (d) wound healing cardiovascular disorders such as myocardial ischaemias; (d) wound healing confectious diseases e.g. cerebral anoxia and epilepsy; and (f) confectious diseases such as viral, bacterial, fungal and parasitic confections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

 Jones KA,
Mckay I,
 The present invention describes a method of determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage comprising identifying whether the individual. has at least one polymorphism in a polymucleotide encoding a protein, where the polymucleotide is one of 81 200-500 nucleotide sequences (S1, see ADC98215 to ADC98315). An agent identified in an method from the present invention which can be used for the prevention or treatment of a disease resulting in susceptibility to low BMD and/or bone damage is useful in the manufacture of a medicament for use in modulating the susceptibility to low BMD and/or bone damage is osteoporosis. The present sequence is used in the exemplification of the present invention.

 The invention relates to an isolated nucleic acid molecule (I) selectively hybridizing to, or comprising at least 95% sequence identity to, any of the 362 nucleotide sequences fully defined in the specification. The nucleic acid molecules and polypeptides are useful for diagnosing, monitoring the presence of, or treating a patient with breast, colon, lung, ovarian, or prostate cancer. This sequence corresponds to a nucleic acid of the invention.
 New cancer specific nucleic acid (CaSNA) molecules, useful for diagnosing, monitoring the presence of, or treating a patient breast, colon, lung, ovarian, or prostate cancer.

 compounds to identify those that have a potential therapeutic benefit for the treatment of neuropsychiatric and neurodegenerative disorders including schizophrenia, bipolar affective disorder (BAD) and autism, as well as Parkinson's and Alzheimer's disease. Accordingly, the compounds of this invention exhibit various activities including neuroleptic, nootropic, antimanic and antidepressant. Furthermore, the screening method used in MPRTS will be automated, such that a large number of test compounds may be rapidly screened with a minimal amount of labour and effort. This polynuclectide is a human CDNA sequence of a gene that is differentially expressed in the presence of a therapeutic compound and represents an exemplary efficacy gene for bipolar affective disorder, given in an exemplification of the invention.
 This invention relates to a novel screening method identified as a multiparameter high throughput screening (MPHTS) assay. Specifically, it refers to an assay that utilises the disease signature of a plurality of specific genes associated with a particular disease, and identifies differential expression between those cells taken from individuals affected by that disease and those that are not affected. The present invention then describes the screening of candidate pharmaccutical

 another immune response, as a reagent in assays designed to quantitatively determine the levels of the protein in biological fluids, and as markers for tissues in which the protein is expressed. The nucleic acid molecules may be used as probes, primers, chemical intermediates and in biological assays. These may also be used in diagnosing, preventing or treating disorders associated with human transporter protein, such as those expressed in foetal heart tissues. The invention is useful in gene therapy. The present sequence is human transporter gene.

 The invention relates to a group of new antibacterial peptides that possess stronger resistance to plant pathogens than that of natural antibacterial peptides, in particular, stronger biochemical activity for resisting bacterial infection. The invention also provides the chemical synthesising process and DNA recombination technology for production of the antibacterial peptides and the application of the antibacterial peptides and the application of the antibacterial peptides and the resisting microbial infection. This sequence represents antibacterial DNA of the invention.

 The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The protectins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a cDNA sequence of the invention.
 New polynucleotides and polypeptides are useful in gene therapy, developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy.
 Linalool synthase from Clarkia breweri (Onograceae) - an acyclic mono:terpine, useful for enhancing the scent production or flavour
 Clarkia breweri S-linalool synthase cDNA

```

(AAW17080), an enzyme that catalyses the conversion of geranyl pyrophosphate to S-linalool, an acylic monoterpene that is a major component of the plant's scent. It was obtd. by PCR amplification of cDNA from petal and stigmata cDNA libraries. The clone can be used to produce S-linalool synthase in host cells, to enhance scent prodn. in a transgenic plant such as petunia, rose, carnation etc., or to enhance the flavour of a transgenic plant such as tomato, grape and tea A cDNA clone (AAT68323) codes for Clarkia breweri S-linalool synthase (AAW17080), an enzyme that catalyses the conversion of geranyl

DNA encoding Clarkia linalool synthase protein - for producing recombinant protein or transgenic plants.

Claim 7; Col 33-40; 30pp; English.

This sequence represents the nucleic acid of the invention, encoding the linalool synthase protein of Clarkia broweri. The DNA is used to produce recombinant Clarkia broweri S-linalool synthase or to produce transgenic plants that express Clarkia broweri S-linalool synthase (especially for the production of enhanced scent and taste in plants)

```
Sequence 1, Application US/08732192A
Patent No. 5849526
GENERAL INFORMATION:
APPLICANT: Pichersky, Eran
 COUNTRY: USA
ZIF: 77210-4433
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM PC-DOS/MS-DOS
COPTMANER: PC-DOS/MS-DOS
 SOFTWARE: Patentin Release #1.0, Version #1.30 CURRENT APPLICATION DATA: APPLICATION NUMBER: US/08/732,192A FILING DATE: 15-NOV-1996 CLASSIFICATION: 435 PRIOR APPLICATION DATA:
 APPLICANT: Pichersky, Eran
TITLE OF INVENTION: USE OF LINALOOL SYNTHASE IN GENETIC
TITLE OF INVENTION: ENGINEERING OF SCENT PRODUCTION
 WHITE & DURKEE
 US 60/005,146

Minster, Submission
 Submitted (01-JUL-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Jun 29, 2005 this sequence version replaced gi:67972689.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Bach contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature

 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 28 contigs. The true order of the pieces is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one m13 subclone.

For a graphical representation of this clone sequence and its analysis see: http://www.wormbase.org/db/seq/sequence?name=W10C8;class=Sequence

# NEIGHBORING CLONE INFORMATION

The 5' clone is W03D8, 2500 bp overlap; the 3' clone is Y71F9AL, 200 bp overlap. Actual start of this clone is at base position 1 of W10C8; actual end is at 36748 of W10C8.

#### NOTES:

Coding seqences below are the result of integration and manual review of the following data: computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE INDEX.html) and The C. elegans ORFeome cloning project (http://worfdb.dfci.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1115-1125, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans researchers.trNAs are predicted using the program trNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

Direct Submission
 Sasaki,T., Matsumoto,T. and Katayose,Y.
Oryza sativa nipponbare(GA3) genomic DNA, chromosome 7, BAC clone:OSJNBb0042J07
assembly quality together with anravailable at http://rgp.dna.affrc.
Location/Qualifiers
 The orientation of the sequence is from M13rev to -21M13 of the BAC clone. This sequence of OSJNBb0042J07 clone has an overlap with OSJNBa0008C11 (DDBJ: AP005098) clone at 5' end and with OJ1664 D08 (DDBJ: AP003931) at 3' end. Detailed information on overlap and

Tel:81-298-38-7441, Fax:81-298-38-7468)
On Jul 22, 2004 this sequence version replaced gi:22531714.
Genes were predicted from the integrated results of the following:
GENSCAN (http://cCR-081.mit.edu/GENSCAN.html), FGENESH
(http://www.scfberry.com/), GeneMark.hmm
(http://www.brigr.org/tdb/glimmerm/glmr_form.html), RiceHMM
(http://www.tigr.org/tdb/glimmerm/glmr_form.html), RiceHMM
(http://ygp.dna.affrc.go.jp/RiceHMM/), SplicePredictor
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://www.tigr.org/software/glimmerm/), BLASTN and BLASTX. The
genomic sequence was searched against NCBI NonRedundant Protein
database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA
sequence database at RGP or DDBJ. Protein homologies of the coding
regions were searched against NCBI NonRedundant Protein database
with BLASTY. ESTS represent the identified cDNA sequences using
BLASTN with the corresponding DDBJ accession no. and RGP clone ID.
Pull-length cDNAs represent the identified cDNA sequences using
BLASTN with the corresponding DDBJ accession no. and RGP clone ID.
Pull-length cDNAs represent the identified cDNA sequences using
BLASTN with the corresponding DDBJ accession no.
A gene without significant homology to a protein is
classified based on the protein name to indicate the homology level
such as same name, 'putative-' and 'like protein. A gene without
significant homology to any protein homology to a protein. A gene predicted
by two or more gene prediction programs is classified as a
'hypothetical' protein according to IRGSP standard. A gene
probable 'hypothetical' protein and is included as a
miscellanceus feature of the sequence is from -21M13 to M13rev of the BAC
clone. This seque
